Assignment

Eric Liu

2023-01-17

Reading and preprocessing data

Clean the datasets

```
detroit = read.csv(file = 'detroit_purchases.csv')
newyork = read.csv(file = 'new_york_purchases.csv')
detroit[] = lapply(detroit, gsub, pattern='\\$', replacement='') #Detroit has '$' in the variable 'amou
detroit[, 1] = as.integer(detroit[, 1]) #Since the first column is char, we need int
detroit[, 2] = as.numeric(detroit[, 2]) #Since the second column is char, we need num
detroit[, 3] = as.numeric(detroit[, 3]) #Since the third column is char, we need num

# install.packages("lubridate")
library(lubridate)
time =  ymd_hms(detroit$purchase_timestamp, tz = "America/New_York") # Adjust EST time of Detroit data
detroit$purchase_timestamp = with_tz(time, "UTC")
detroit$purchase_timestamp
```

```

Assignment 1

Normalize the type field to a product line (New_York dataset)

```
count_1 = 1
ny_type_new = list() #create a list for output
for (x in newyork[ ,5]){
  if (x %in% c("cakes", "pizzas", "puffs"))
    ny_type_new[count_1] = print("bakery")
  else if (x %in% c("milk", "cheese"))
    ny_type_new[count_1] = print("dairy")
  else
    ny_type_new[count_1] = print("vegetable")
count_1 = count_1 + 1
}
```

```
## [1] "bakery"
## [1] "bakery"
## [1] "vegetable"
## [1] "vegetable"
## [1] "bakery"
## [1] "vegetable"
## [1] "dairy"
## [1] "bakery"
## [1] "bakery"
## [1] "dairy"
## [1] "bakery"
## [1] "bakery"
## [1] "vegetable"
## [1] "vegetable"
## [1] "vegetable"
## [1] "vegetable"
## [1] "dairy"
## [1] "bakery"
## [1] "bakery"
## [1] "dairy"
## [1] "bakery"
## [1] "bakery"
```

```
## [1] "vegetable"
## [1] "dairy"
## [1] "vegetable"
## [1] "vegetable"
## [1] "bakery"
```

```
newyork$type = ny_type_new
```

Merge two CSV files into a single dataset

```
data_1 = rbind(detroit, newyork)
data_1$id = c(1:54) #re-range the id order
data_1
```

```
##    id      barcode amount   purchase_timestamp      type

```

Assignment 3

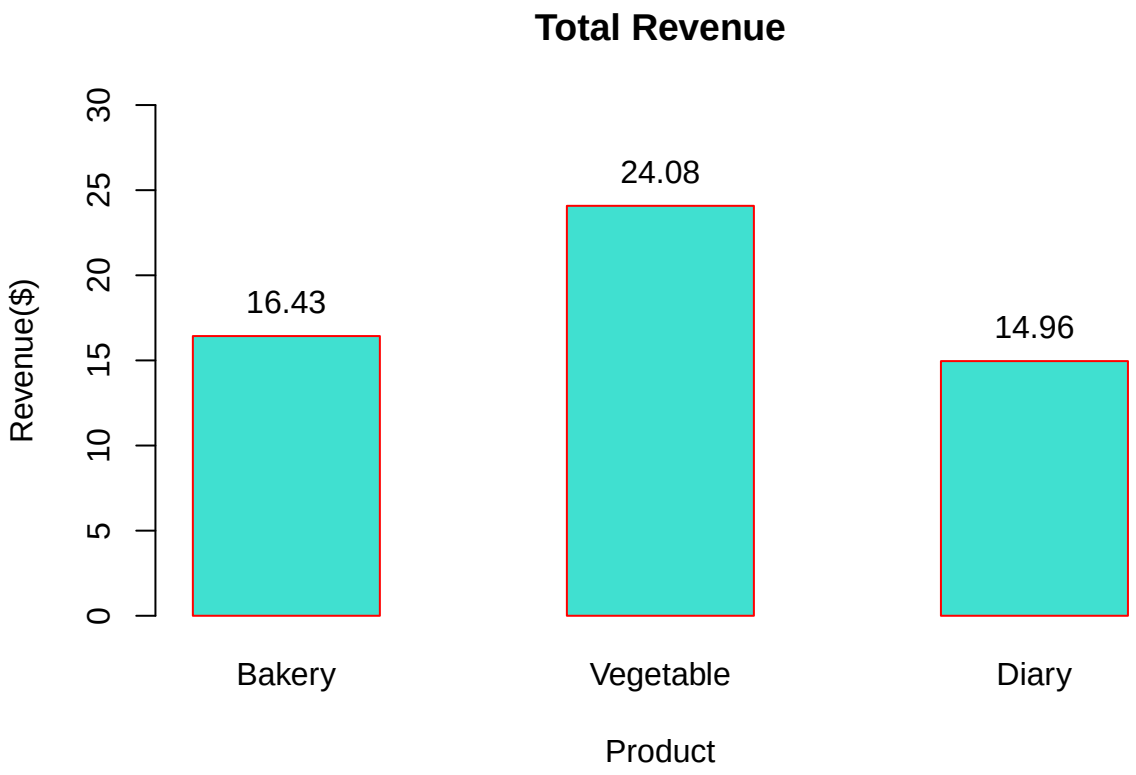
3.1) Bar chart for total revenue in each product line on 1/2

```
# install.packages("tidyverse")
library("tidyverse")
data_new %>% group_by(type) %>% summarise(total_revenue = sum(amount))
```

```
## # A tibble: 3 x 2
##   type      total_revenue
##   <list>            <dbl>
## 1 <chr [1]>          24.1
## 2 <chr [1]>          15.0
## 3 <chr [1]>          16.4
```

```
x1 = c("Bakery", "Vegetable", "Diary")
y1 = c(16.43, 24.08, 14.96)
total_revenue = data.frame(x1, y1)

bar = barplot(height = total_revenue$y1, names = total_revenue$x1, xlab = "Product", ylab = "Revenue($)
      main = "Total Revenue", border = "red", ylim=c(0,30), space = 1, width = 1)
text(bar, total_revenue$y1 + 2, paste(total_revenue$y1, sep=""), cex = 1)
```



3.2) Histogram for the number of items purchased for each hour on 1/2

```
# install.packages("dplyr")
# install.packages("ggplot2")
library(dplyr)
hour = format(as.POSIXct(data_new$purchase_timestamp), format = "%H") #filter out the hour first
data_new$hour = hour
number_of_purchase = data_new %>% group_by(hour) %>% summarise(number_of_purchase = n_distinct(id))
number_of_purchase$hour = sub("^0+", "", number_of_purchase$hour) # get rid of situation like "01", "04
number_of_purchase
```

```
## # A tibble: 9 x 2
##   hour  number_of_purchase
##   <chr>              <int>
## 1 1                      2
## 2 2                      1
## 3 4                      3
## 4 13                     3
## 5 15                     2
## 6 16                     2
## 7 19                     2
## 8 21                     2
## 9 23                     3
```

```
count_2 = 1
time1 = list() #create a list for output
x2 = c(0:23)
for (y in x2){
